

Company: Amazon

Role: SDE-1

Difficulty: Medium

Round: All Rounds

Overall Experience:

The process started with an Online Assessment containing 2 coding questions on HackerRank. First question was sliding window maximum, and the second was a shortest path in a grid.

Technical Round 1: Design a parking lot system with OOP principles. Make sure to define clear class relationships and use appropriate design patterns (like Strategy and Singleton). Also asked to implement an LRU cache using a doubly linked list and a hash map from scratch.

Technical Round 2: System design of a URL shortener like bit.ly. Focus on scalability, hashing collision resolution, database selection (NoSQL vs SQL), and caching strategies.

Bar Raiser: Deep dive into past internship projects, asked about architectural trade-offs and Amazon's Leadership Principles.
